

CP Visit Types, Forms & Completion Flows

A field guide to Client Place visit creation, proof capture, type-specific forms, and recorded outcomes across MMS web and the Mconnect mobile app.

Document status	Current implementation reference
Scope	CP creation on MMS web and completion on Mconnect mobile
Audience	Marketing, field staff, QA, product, and operations
Version date	28 July 2026

How to use this guide

Start with the summary matrix, then use the numbered lifecycle for end-to-end testing. The type-specific sections show exactly which fields and proof steps appear for each CP category.

Implementation note: this guide documents observed application behavior. Items marked “Confirm business intent” are current behaviors that may need a product decision.

1. Purpose and scope

A CP (Client Place) visit is created in MMS, assigned to field staff, executed in the Mconnect app, and closed with proof and an outcome. The selected CP type determines the final form, validation, and recorded outcome.

Scope boundary

This document covers CP visit behavior only. Site Visit (SV), inspection, and fleet workflows are included only where they are directly linked to a CP outcome.

2. CP types at a glance

CP type	Primary purpose	Completion experience	Recorded result
SV cum CP	SV + CP combined visit	Locked SV confirmation when properly linked	SV accepted or rejected
Follow-up	Continue a postponed client	Standard 4-tab outcome sheet	Booking / SV / follow-up / not interested
Booking CP	Booking paperwork visit	Standard 4-tab outcome sheet	Selected standard outcome
Collection CP	Collect customer payment	Payment entry form	collection_done
Old Client	Re-engage an existing client	Required visit remarks	old_client_visited
Gift Distribution	Deliver a loyalty gift	OTP + handover photo; no text form	gift_distributed

Creation codes: sv_cum_cp, follow_up, booking_cp, collection_cp, old_client, gift_distribution.

3. Shared creation form

Client	Mobile number is required. A matching lead is linked; when no lead exists, staff can enter the client name and create/link the lead and place.
Visit setup	Project, CP type, field staff, date, and time are required.
Address	Door no., street, address line 1, address line 2, city, state, pincode, map coordinates/pin, and optional Google Maps link.
Notes	Optional operational notes for the visiting staff.
Booking gate	Collection CP and Booking CP require a confirmed booking for the entered mobile number. Creation is blocked when no eligible booking exists.

Creation flow

1. Enter the client mobile number and search for the lead.
2. Link the matching lead, or enter the client name when no match exists.
3. Select the project and CP type.
4. For Collection CP or Booking CP, select an eligible confirmed booking.
5. Assign field staff and set the scheduled date and time.

6. Confirm or correct the client-place address and map pin.
7. Add optional notes and create the CP visit.

4. Shared mobile execution flow

Core rule

The app separates arrival proof from the business outcome. The exact proof sequence and final form change according to the CP type.

1. Open the assigned CP visit and start the trip.
2. Travel to the client place. The app checks the configured reaching radius before arrival actions are enabled.
3. Choose whether the staff member has seen the client.
4. If Yes, complete the type-specific photo and OTP sequence.
5. Open the correct completion form for the selected CP type.
6. Submit the form. The CP is closed with the recorded outcome and proof metadata.

Client seen decision

Decision	Proof sequence	Next action
Yes — client met	Arrival photo + OTP for most types. Gift Distribution uses OTP first, then a gift-handover photo.	Open the type-specific completion form.
No — client not met	Capture one photo. OTP is not requested.	Close using the type-specific no-show result and reason.

Proof rules by type

CP type	Before form opens	Completion proof
Follow-up / Booking CP / standard	Arrival photo, then OTP	Submitted outcome sheet
Collection CP	Arrival photo, then OTP	Payment details; proof upload optional
Old Client	Arrival photo, then OTP	Required remarks
Gift Distribution	OTP first	Gift-handover photo
SV cum CP	Arrival flow	SV confirmation when linked to SV payload

System result

Status: The CP is marked completed after the required proof and outcome call succeeds.

Audit data: Photo/upload references, OTP verification, timestamps, client-met flag, reason, and outcome are retained by the visit flow where available.

5. Standard CP outcome sheet

Follow-up, Booking CP, and legacy/direct CP visits use the standard four-tab outcome sheet. Each tab represents a different business result.

Tab	When used	Main result
Booking	The visit converts into a booking or booking record.	Creates or updates booking data.
Site Visit	The client agrees to visit a project/site.	Creates a scheduled Site Visit.
Postpone	The client needs another CP contact date.	Records a follow-up date and reason.
Not Interested	The client declines or has blocking objections.	Records one or more objection reasons.

5.1 Booking tab

Form shape

Booking is a multi-step form. Fields can be shown or hidden by booking type, payment mode, referral, previous-booking conversion, exchange, and finance selections.

Client details	Phone, title, name, optional image, father/spouse name, date of birth, anniversary, alternate and WhatsApp numbers, email, nationality, and home address with map details.
Professional details	Profession, designation, department or other role, and annual income.
Office details	Office name, email, mobile, phone, and complete office address.
Booking details	Booking reference/type/date, project, plot, property type, duplicate booking, source/referral data, linked site visit, CEF number, and conditional previous-booking or exchange details.
Charges and offers	Booking cost, guideline value, special consideration/discount, approver, reason, validity, promotional offer, offer value, and terms.
Payment	Registration/GST/document/patta/other charges, customer payment category, bank loan amount, advance mode/amount, transaction details, proof, cheque/instrument fields, payment plan, installment schedule, and preferred registration date.
Staff and KYC	AVP, GM, Senior Manager, BDO, Telecaller, Aadhaar/PAN with uploads, two references, document preparation, and Draft or Confirmed state.

5.2 Site Visit tab

- Project, visit date, and visit time.
- Travel mode: own vehicle or cab; pickup address when required.
- BDO or Keep Original assignment.
- Site Incharge, HOD, AVP, GM, and Senior Manager.
- Visitor count and visitor details.

5.3 Postpone tab

- Next visit date.

- Reason or notes.

Meaning: This postpones the CP/follow-up interaction. It is separate from postponing an already-created Site Visit.

5.4 Not Interested tab

At least one reason is recorded. Detail fields appear for the selected reasons:

- Price; distance; location; development in sourcing area; preferred plot not available; loan eligibility; internal staff approach/behaviour; driver approach/behaviour; and additional notes.

6. Type-specific completion forms

6.1 Collection CP

Eligibility	A confirmed booking/customer must be selected. When exactly one is eligible, it may be selected automatically.
Amount received	Required and must be greater than zero.
Payment mode	UPI, Cash, NEFT, RTGS, Cheque, DD, or Bank. UPI is the default.
Reference	Transaction ID, UTR, cheque number, or other payment reference is required.
Payment proof	Optional upload. Supported formats: PDF, JPG, PNG, or WebP, up to 10 MB.
Notes	Optional.
Recorded result	collection_done. The customer collection is saved for Accounts review.

Validation detail

The current implementation requires a transaction/reference value even though an older code comment describes it as optional. The running validation should be treated as the source of truth.

6.2 Old Client

Form	Visit Remarks.
Required field	Remarks describing the discussion or visit result.
Recorded result	old_client_visited.
Client not present	Photo only, no OTP, with reason "Old client visit — client not present."

6.3 Gift Distribution

Form	No typed completion form.
Proof order	Verify OTP first, then choose Confirm Gift Distribution and capture the handover photo.
Camera cancelled	The visit remains retryable; it is not closed.
Recorded result	gift_distributed.
Client not present	Photo only, no OTP, with reason "Gift distribution — client not present."

6.4 SV cum CP

Intended behavior	Open a locked Site Visit confirmation/rejection form for the linked proposed Site Visit.
Typical details	Project, date, time, travel/pickup mode, pickup address, BDO, Site Incharge, management assignments, and visitor count/details.
Result	Accept/confirm or reject the proposed Site Visit.
Dependency	The CP must carry the linked SV/proposed-site-visit payload. The cpType value alone does not always force the locked SV form.

6.5 Follow-up and Booking CP

Type	Creation rule	Completion form
Follow-up	Created to continue a postponed client interaction.	Standard outcome sheet: Booking, Site Visit, Postpone, or Not Interested.
Booking CP	Requires an eligible confirmed booking at creation.	Also uses the standard outcome sheet; it does not currently have a separate dedicated completion form.

7. Client-not-present flow

When staff choose “No, I did not see the client,” the app captures a photo and closes the visit without OTP. The final outcome depends on the CP type.

CP type	Recorded outcome	Reason / interpretation
Gift Distribution	gift_distributed	Gift distribution — client not present
Old Client	old_client_visited	Old client visit — client not present
Collection CP	collection_done	Collection visit closed with client-not-present reason
Default / standard	other	Generic client-not-met closure

Confirm business intent

Special CP types currently use their terminal success-family outcome even when the client was not met. Reports must inspect clientMet=false and the reason to distinguish a completed business action from a no-show closure.

8. End-to-end flow by CP type

Type	Creation	Field proof	Final action
SV cum CP	Create + link proposed SV	Reach → client seen → proof	Confirm/reject linked SV
Follow-up	Create follow-up CP	Reach → photo → OTP	Choose one standard outcome
Booking CP	Confirmed booking required	Reach → photo → OTP	Choose one standard outcome
Collection CP	Confirmed booking required	Reach → photo → OTP	Enter collection payment
Old Client	Create old-client CP	Reach → photo → OTP	Submit required remarks
Gift Distribution	Create gift CP	Reach → OTP → handover photo	Close as gift distributed

9. Required versus optional fields

Context	Required	Optional / conditional
Create CP	Client mobile, project, CP type, staff, date, time, core address	Notes, some address/map detail depending on source
Collection	Booking/customer, amount, payment mode, transaction/reference	Payment proof, notes
Old Client	Visit remarks	None in the dedicated form
Gift Distribution	OTP and handover photo	No text fields
Standard Site Visit	Project/date/time and applicable assignment data	Pickup details depend on travel mode
Postpone	Next date	Reason/notes may depend on UI validation
Not Interested	At least one reason	Additional notes and reason-specific details

10. Current-state findings for QA and product

Finding	Observed behavior	QA / decision point
SV cum CP linkage	The locked SV form depends on linked proposed-SV payload flags, not only cpType=sv_cum_cp. A manually created SV cum CP without that payload may fall back to the generic outcome sheet.	Verify both linked and manually created records.
Booking CP completion	Booking CP is gated by confirmed booking during creation, but completion still exposes the standard four outcomes.	Confirm whether Booking CP should remain flexible or have a dedicated booking-only form.
Collection proof	Payment proof upload is optional; transaction/reference is required.	Ensure labels and training material match this validation.
No-show outcome reporting	Some special types close with their normal terminal outcome even when the client was not met.	Reports should use the client-met flag and reason, or the outcome contract should be revised.

11. Suggested QA checklist

1. Create one CP of each type with a valid lead, project, staff member, schedule, and address.
2. Verify Collection CP and Booking CP cannot be created without a confirmed booking.
3. Test the client-seen Yes path and confirm photo/OTP order for every type.
4. Test the client-not-present path and verify no OTP is requested.
5. For Collection CP, verify required amount/reference and optional proof upload.
6. For Old Client, verify blank remarks are rejected.
7. For Gift Distribution, verify camera cancellation keeps the visit retryable.
8. For SV cum CP, test both a properly linked proposed SV and a record carrying only the cpType.
9. Confirm the final status, outcome, client-met flag, reason, proof URLs, and timestamps in web reporting.

12. Terminology

CP	Client Place visit.
SV	Site Visit.
BDO	Business Development Officer.
Arrival proof	The evidence captured before the business outcome, commonly a photo, OTP, timestamp, and location.
Outcome	The business result recorded when the visit closes.
Client met	A distinct boolean/decision that should be read together with the outcome.
